RPC PLASTIC WEIRPLATES

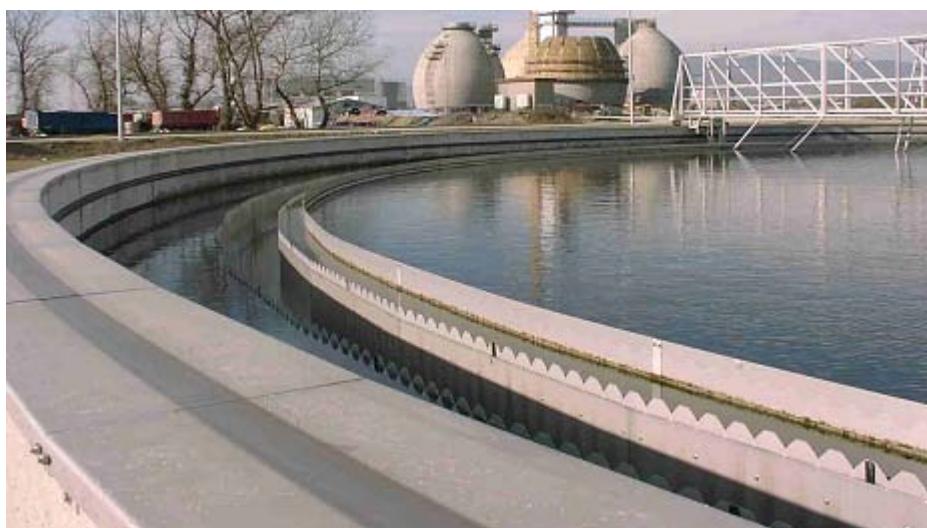

Many settlement and distribution tanks require the need to separate the scum from the clear water and most tanks will require a Weirplate and Scumboard located on its perimeter.

Weirplates are also useful in monitoring flow or controlling the rate of flow of water through channels.

Our range of Weirplates & Scumboards are manufactured from a RPC plastic material specifically designed for use with this equipment. This material has advantages over the traditional GRP as follows: -

1. Recycled polycarbonate is environmentally sound
2. RPC is virtually unbreakable
3. RPC will not splinter during drilling
4. No need to seal the edges after trimming
5. Thickness range available 5, 6 and 8
6. Plates supplied with 20 x 6 SA sponge rubber seals
7. RPC offers good weather resistance
8. RPC is light in weight with a specific gravity of 1-2
9. Specified by the major water companies

There are two types of Weirplates. The plain type for use wherever a level Weir Edge is required around a tank periphery and the 90 degree V-Notched type. The notched type is generally preferred in installations where fluctuations in flow rates are to be expected

RPC PLASTIC WEIRPLATES

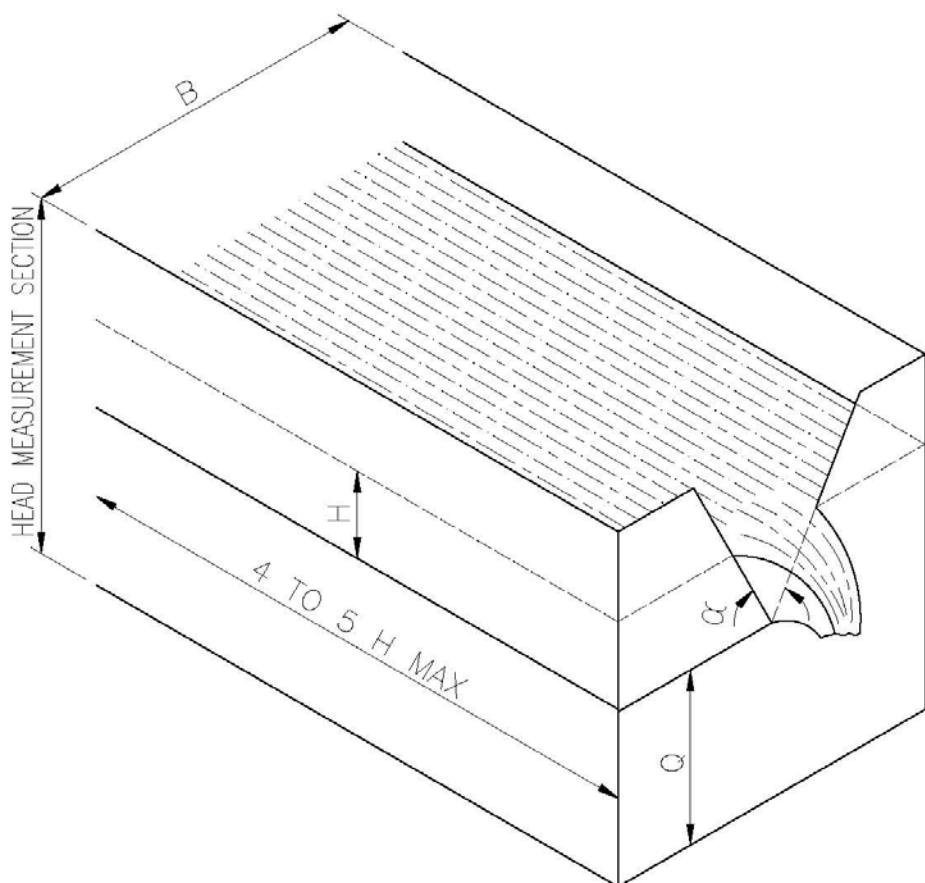

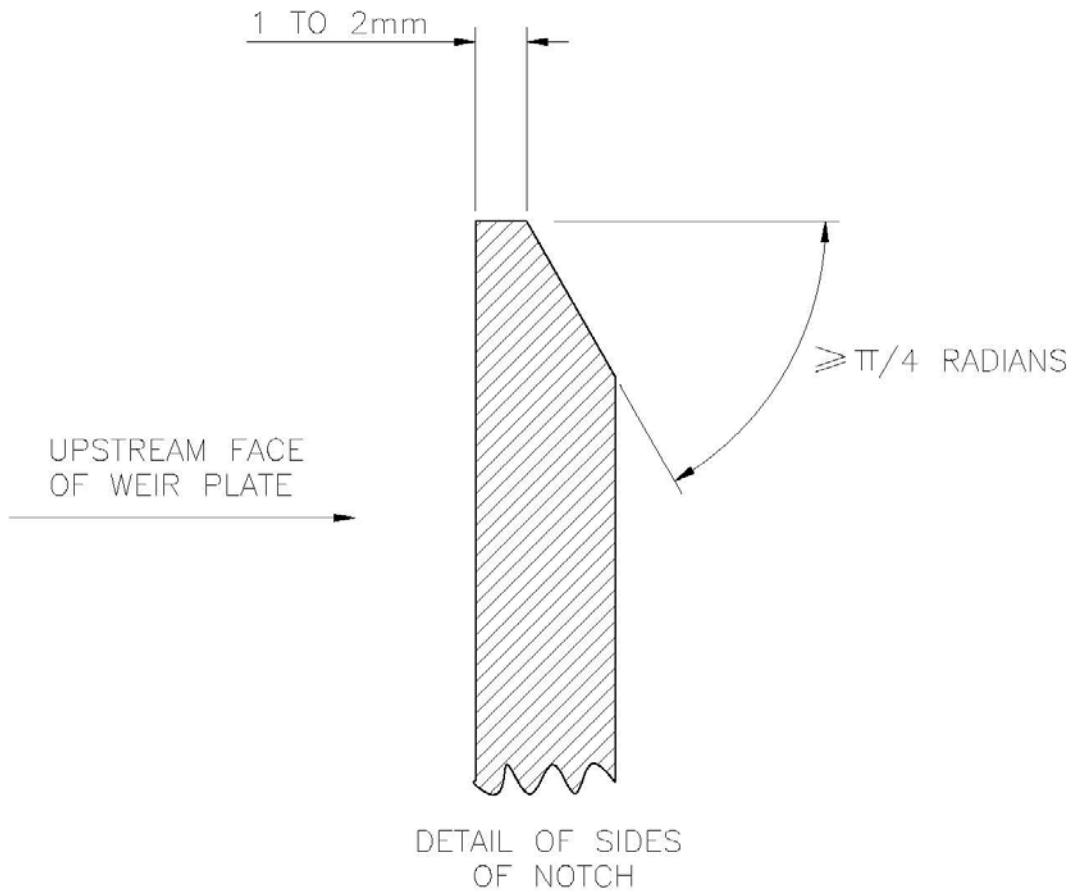

TRIANGULAR-NOTCH THIN-PLATE WEIR

Specifications for the standard weir

The triangular-notch thin-plate weir consists of a V-shaped notch in a vertical, thin plate. See diagrammatic illustration of the triangular-notch weir for dimensional details. The weir plate shall be plane and rigid and perpendicular to the walls and the floor or the channel. The upstream face of the plate shall be smooth (in the vicinity of the notch it shall be equivalent in surface finish to that of rolled sheet-metal).

The bisector of the notch shall be vertical and equidistant from the two walls of the channel. The surfaces of the notch shall be plane surfaces, which shall form sharp edges at their intersection with the upstream face of the weir plate. The width of the notched surfaces, measured perpendicular to the face of the plate, shall be between 1 and 2 mm.

To ensure that the upstream edges of the notch are sharp, they shall be machined or filed, perpendicular to the upstream face of the plate, free of burrs or scratches and untouched by abrasive cloth or paper. The downstream edges of the notch shall be chamfered if the weir plate is thicker than the maximum allowable width of the notch surface. The surface of the chamfer shall make an angle of not less than $\text{Pye}/4$ radians (45 degrees) with the surface of the notch (see Triangular – notch, thin plate weir Drawing). The weir plate in the vicinity of the notch preferably shall be made of corrosion-resistant metal; but if it is not all specified smooth surfaces shall be kept coated with a thin protective film (for example, oil, wax, silicone) applied with a soft cloth.

TRIANGULAR – NOTCH, THIN PLATE WEIR

GAUGING WEIRS

(1) FOR 90 PERCENT V NOTCHES

Based on THOMSONS'S FORMULA : - $Q = 0.305 \frac{H^5}{2}$

Where Q = cubic ft. per minute, and H = head in inches

Depth of Flow in inches	DISCHARGE			Depth of Flow in inches	DISCHARGE		
	Gallons per minute	Gallons per hour	Gallons per 24 hours		Gallons per minute	Gallons per hour	Gallons per 24 hours
1	1.9	114	2,736	9	463.3	27,796	667,100
2	10.8	648	15,552	10	602.9	36,174	868,180
3	29.72	1,783	42,792	11	765.1	45,903	1,101,700
4	61.02	3,661	87,864	12	947.9	56,872	1,364,900
5	106.6	6,394	153,460	13	1,158	69,471	1,667,300
6	168.1	10,086	242,060	14	1,394	83,611	2,006,700
